

Hello — and thanks for taking a look at my work!

My name is Rich Kurz and I am an experienced graphics design professional. My philosophy has grown simpler through the years. Good design is not about me, but about us. I want to do good work that serves the needs of my client and that I am proud to put in my portfolio. This pdf shows some of my capabilities.

**Note that all concepts and initial drawings are owned by Hewlett-Packard Co. The images in this document are my own and are under copyright to Rich Kurz.**

Perhaps my first tour-de-force in Photoshop was the cover image for “Reviewing and Testing Desktop Scanners”. It involved elements both scanned and created in the program, and then all layered together. It took three days using Photoshop 2.1 on a Mac Ilfx with an 80 MB HD. The layers feature of Photoshop 3 was a HUGE advance! Just as good were the spot illustrations that visually explained the different terms described in this guide.

The guide itself was a marketing piece written by an engineer from the scanner division for other engineers who would review the product. So the drawings all had to be technically accurate. It was a good introduction and I learned how scanners really worked. I even got to talk with Baxter Black to secure permission to use one of his cartoons!

The document went thru a revision the next year. The leather look was scanned from a green stamp album and then color shifted. I incorporated scanned images into the original inside spot graphics, which improved their ability to show what was happening.

Two years later, a third revision required another cover design, and would be perfect bound. And this time, the inside images would be in color instead of black and white. I recreated them in color and redesigned the cover, still keeping the original image.

Deliverables: front & rear cover, 8½"×11" trimmed, spiral bound (1st & 2nd editions), CMYK (plus gloss laminate for the 3rd edition)  
Cover created in Photoshop and from scanned images  
Spot illustrations created in CorelDraw and Illustrator using scanned images  
Provided Matchprint of covers for printer

I am available to discuss your design, illustration, marketing, and advertising needs. Let's talk!

Rich Kurz

## 2 Relationship between Scanned Pixel & Printed Dither

a Comparison of one scanned pixel with one halftone cell representing one pixel

Since black & white output devices (printers) can only print in one color, or shade, halftoning is used to convert an image with shades of gray to one with only black and white values.

b Line screen cells at 25% value steps

Instead of using one pixel with 16 values, the printer will use 16 dots (or pixels) with one value each. These 16 pixels become a single cell with 16 possible values and represents a line screen dot.

# 1 PPI (pixels per inch)

PPI = input resolution

This image is composed of 256 pixels (16 rows by 16 columns). Each pixel will have one of 16 values (or shades) of gray, in this example. A typical 8-bit scanner allows 256 values of gray for each pixel.

# Resolution of detail

A scanner should be able to resolve detail in both light and dark areas in the same image at the same exposure setting.

Fine detail in dark and light areas  
(600 ppi scanner)

Fine detail in dark and light areas  
(300 ppi scanner)

Missing detail in dark and light areas  
(400 ppi scanner)

## Jaggies and scaling method

1

Original image

2

Scaled by scanner

3

Scaled in application

# Full spectrum grayscale scanning

**1** Original color image

**2** Green channel only scan

**3** Full spectrum grayscale scan

Note the difference in the horses' collars and the red flower and heart.

# A test for color balance

Poor balance

Good balance

1 Red scan

2 Green scan

3 Blue scan

4 Combined image

a Single light, single exposure

b Single light, multiple exposure

c multiple lights, multiple exposure

# Typical interpolation methods

**1** Original image quality

**2** Low quality scaling

**3** High quality scaling

# Shadow detail

8-bit scan

10-bit scan

Histogram from the 8-bit scan

Histogram from the 10-bit scan

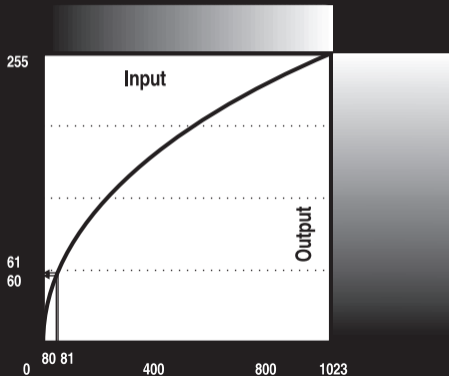

# Increased tonal resolution

8- (24-) bit scanner

10- (30-) bit scanner

# 1 Limited by optical quality

Sampling rate (ppi)    Optical quality
